---

Hi Everyone!

i have a problem using the multiport module within an openvz container.

hope someone can help me out!

problem description:

when using the multiport module within a openvz container, i get an error. all other options/modules work fine.

the command also works fine on the host itself!

```
>iptables -t mangle -A OUTPUT -p tcp -m tcp -m multiport -d 192.168.22.4 --dports 3307,3306 -j Out_RULE_2
```

returns

```
FATAL: Could not load /lib/modules/2.6.26-2-openvz-amd64/modules.dep: No such file or directory
```

```
FATAL: Could not load /lib/modules/2.6.26-2-openvz-amd64/modules.dep: No such file or directory
```

```
>iptables -t mangle -A OUTPUT -p tcp -m tcp -j Out_RULE_2
```

works out fine

ANY IDEAS?

container system (Debian)

```
-----  
>cat /proc/net/ip_tables_matches  
udplite  
udp  
tcp  
contrack  
contrack  
state

ok, i found the solution.

depmod -a

recreates the required files in the module directory. after that everything worked out fine.

Hello,

I am having the same problems that you are having but when starting APF firewall.

Did you run depmod -a on the host server?

I have this on vz.conf:

```
[code]IPTABLES="ipt_REJECT ipt_tos ipt_TOS ipt_LOG ip_conntrack ipt_limit ipt_multiport  
iptables_filter iptable_mangle ipt_TCPMSS ipt_tcpmss ipt_ttl ipt_length ipt_state iptable_nat  
ip_nat_ftp"[code]
```

My container is also a Debian.

The strange thing is that APF works on containers running CentOS.

Hi fernandomm,

You will have to run depmod -a in the container. Probably it will then tell you that the target directory (/lib/modules/2.6.26-2-openvz-amd64/) does not exist. create it as root and then re-run depmod -a. iptables should then work with all loaded modules.

The strange thing is that APF works on containers running CentOS.

as far as i can see the problem lies in the fact that the depmod file was not created in the debian template / container. this probably is based on the fact that this module dependency file normally is created when the kernel image is installed. as this is not necessary when using openvz it has to be done manually and is not described in the "debian template creation instructions" found in the wiki.

Since it works out for CentOS i could imagine that either the CentOS template contained this informations already (perhaps it was a preconfigured download) or something similar.

best regards

nicolas
