I see that it hit git. I assume that this is very experimental at the moment? Is it safe to try at this point or am I asking for trouble. I have been running 2.6.27-ovz for years without issue but could use stable ext4, kvm and linux-tv advancements.

Yes, its experimental. NULL pointer dereference pretty soon after the boot started. And since my rootfs is ext4dev and 2.6.32 took away the test_fs flag it was a little painful to recover. Good thing I had a bootable USB stick with sysrescuecd on it..

Seems like the 2.6.32 has been released

http://wiki.openvz.org/Download/kernel/2.6.32/2.6.32-afanasyev.1

So it's time to test it

I had it running about 1 week ago. However after I booted I thought that it would be better to either wait a month or so for any potential initial bugs to get fixed or test on a machine that was less critical. I can not have this machine go down..
