Subject: Removing unnecessary packages in HN

I'd like to remove as much software in my HN as possible.

I'm running Centos 5 and while I installed very little off the Centos Install disk, there is currently 344 installed packages as listed by yum on the HN.

I know every configuration is a bit different, but I figure the less software I have installed, the better.

Is there a list of packages that OpenVZ HN should have installed and maybe another list of software that could be removed?
