I been trying to get this to work but seems to be stuck on what else left to do, I had come up with a way to add an additional ip to the container and it was works for five minutes and then breaks which makes me think I am doing something really wrong. Here the setup I am trying to accomplish.

OpenVZ Server, eth0 - 4.2.2.2 (Public), eth1 10.0.0.1(Private)

OpenVZ Container eth0 - Public IP, eth1 Private IP.

Anyone have any suggestions ?
