Subject: HN on private network, VE on public/private network

I read this wiki page: http://wiki.openvz.org/VEs_and_HNs_in_different_subnets

But, I'm still confused how to set up the HNs on a private network and the VEs on both the private and a public network.

I don't want my HNs accessible to the internet and only want 1 or 2 VEs on a HN accessible from the internet.

I have eth0 hooked up to the public internet and I have eth1 hooked up to the private network. I only have a limited number of public internet IPs and I only want to assign them to a VE or two. I don't want any public internet IPs assigned to the HN, if possible.

I'm running Centos 5.

Can someone summarize the commands I need to do to set this up?

I know they are listed in the wiki page above, but I didn't follow exactly what the page was saying to do.
