Hello.

Server with 6 containers worked fine about a year, but after last reboot I can't start one VZ.

2010-08-08T22:00:08+0600 vzctl : VE 101 : Starting VE ...
2010-08-08T22:00:08+0600 vzctl : VE 101 : VE is mounted
2010-08-08T22:00:08+0600 vzctl : VE 101 : Adding IP address(es): 192.168.69.101
2010-08-08T22:00:09+0600 vzctl : VE 101 : Setting CPU units: 1000
2010-08-08T22:00:09+0600 vzctl : VE 101 : Configure meminfo: 131072
2010-08-08T22:00:09+0600 vzctl : VE 101 : Set hostname: app1
2010-08-08T22:00:09+0600 vzctl : VE 101 : VE start in progress...

and nothing more.

spirit:~# vzctl status 101
VEID 101 exist mounted down

spirit:~# vzlist -a
```
      VEID      NPROC STATUS  IP_ADDR         HOSTNAME
        8         21 running 192.168.69.8    zab
       100         8 running 192.168.69.100  frontline
       101         - mounted 192.168.69.101  app1
       102         9 running 192.168.69.102  app2-phpbb1
       111        24 running 192.168.69.111  db1
```

spirit:~# vzctl --version
vzctl version 3.0.22

spirit:~# uname -a
Linux spirit 2.6.26-2-openvz-686 #1 SMP Wed Nov 4 22:06:32 UTC 2009 i686 GNU/Linux

dmesg:
[4920.505311] CT: 101: started
[4922.136512] CT: 101: stopped

File /var/lib/vz/private/101/var/log/boot is empty.

Forum search has found similar symptoms with ubuntu, but thats a plain Debian on host and into VZ.

Any ideas?
Thanks.

Hi,

- plz start ct with --verbose and post the output
- which Debian Version is running inside ct, etch, lenny or squeeze ... sid ?
- what kind of progs should running inside this ct ?

Bye,
Thorsten

Hi all!
sorry for delay, I was traveled to the server, it is far.

I examined the server and found additional problems, in particular, a memory errors and kernel oopses, which was not at the time of writing the top post. After memory replacement all VE's starting and running fine.
My mistake was that I had not tried to reboot the server before posting - but it was impossible at the moment.

So I'm sure that root cause is hardware fault.

Thank you!
