Subject: FATAL: Error inserting loop module after Squeeze kernel update

Hello,

I've just updated a Debian Squeeze server with linux-image-2.6-openvz-amd64 package, and after reboot I cannot mount throught /dev/loop1:

.- The mount command says "/dev/loop1: File or directory not found".
.- I've checked /dev/loopX and there's aren't any loop devices.
.- The "loop" kernel module is not loaded.
.- When I try to load it with "modprobe loop" I get "FATAL: Error inserting loop (/lib/modules/2.6.32-5-openvz-amd64/updates/loop.ko): Invalid module format".

How can I solve it? Thanks,

Hello,

It's solved.
The problem was the old "loop" module not properly updated by module-assistant.
Carefully removing old package made with m-a and rebuilding worked for me.

Regards,
