hi,

i am running debian queeze and 2.6.32-5-openvz-amd64 kernel.

Debian is running well as virtual server.

SuSE (taken precreated suse 11.3 image from openvz download page)
is starting:

Starting container ...
Container is mounted
Adding IP address(es): 10.1.2.3
Setting CPU units: 10000
Set hostname: susetest
File resolv.conf was modified
Container start in progress...

It shows up in the list privided by vzlist for 2-3 seconds and then it just vanishes from the vzlist provided list.

So the suse vps can not be started.

In the config i filled in

OSTEMPLATE="suse"

should be right.

Is there any specific trick or any idea where to search ?

Its all plain installed squeeze.

Thank you
