Subject: Checkpointing VEs on halt/reboot

Hi guys! tell me one thing: why does openvz stop the containers on reboot (or shutdown) when they can be checkpointed and restored on next boot???

I am using debian and when i type /etc/init.d/vz stop it stops all containers... I'd like them to be suspended instead and restored on /etc/init.d/vz start (next boot). Is it possible? Can i restore VE after kernel upgrade?

BTW XEN does this by defautl...
